

ROOTS® RAM™ VJ WHISPAIR™

Water sealed vacuum blowers, frames 406J, 412J & 624J

Design and construction features frames 406J through 624J

- Low noise level, less operating power required.
- Improved volumetric efficiency & reduced operating temperatures.
- Alloy steel timing gears.
- Cylindrical roller bearings.
- Piston ring air seals.
- Lip-type oil and shaft seals.
- Splash oil lubrication.
- Horizontal and vertical configurations available.

ROOTS® RAM™ WHISPAIR™ water-sealed vacuum exhausters are heavy-duty units designed with integral-shaft ductile iron impellers. Whispair vacuum exhausters reduce noise and power loss by utilizing an exclusive wrap-around plenum and proprietary WHISPAIR jet to control pressure equalization – feeding backflow in the direction of impeller movement, thereby aiding rotation.

Basic dry vacuum pump description

The headplates and rigid, one-piece casing are grey iron, while the drive end cover and gear cover are aluminum. Carburized and ground alloy steel spur timing gears are taper mounted on the shafts, secured with a locknut. Cylindrical roller bearings are used. Piston rings reduce air leakage through the shaft openings in the headplates, and lip-type oil seals prevent lubricant from entering the air chamber. ROOTS® RAM™ WHISPAIR™ vacuum exhausters incorporate splash oil lubrication at both ends of the units. A lip seal on the drive shaft prevents shaft seal oil leaks.

All frame sizes are designed with detachable rugged steel mounting feet which permit in-field adaptability to either vertical or horizontal installation requirements.

The top shaft is extended for drive on side outlet vacuum exhausters, and the left or right shaft can be extended for drive on bottom outlet vacuum pumps.

An inlet spray nozzle and seal water flow meter are supplied for water injection.

Warranty period

12 months from date of original unit start-up or 18 months from date of original shipment, whichever occurs first.

Operating principle

Incoming gas is trapped by the impellers. Simultaneously, pressurized gas (right) is being discharged. As the lower impeller passes wrap-around flange, WHISPAIR jet equalizes pressure between trapped gas and discharge area, aiding impeller movement and reducing power. Impellers move gas into the discharge area (right). Backflow is controlled, resulting in reduction of noise relative to conventional gas pumps.
